AB The present invention relates to a newly identified human PGP synthase. The invention also relates to polynucleotides encoding the PGP synthase. The invention further relates to methods using the PGP synthase polypeptides and polynucleotides as a target for diagnosis and treatment in PGP synthase-mediated or -related disorders. The invention further relates to drug-screening methods using the PGP synthase polypeptides and polynucleotides to identify agonists and antagonists for diagnosis and treatment. The invention further encompasses agonists and antagonists based on the PGP synthase polypeptides and polynucleotides. The invention further relates to procedures for producing the PGP synthase polypeptides and polynucleotides.

AB The present invention relates to diagnostic applications. For autoimmune diseases more particularly, it is demonstrated herein that individuals with SLE, APLA, MCDS and PSS have antibodies that are specific for SR proteins. Thus, in particular aspects the present invention provides methods and compositions for diagnosing autoimmune disease using SR proteins and antibodies to detect the presence of SR protein-specific antibodies in an individual suspected of having autoimmune disease, wherein the presence of such antibodies is indicative of said individual suffering from autoimmune disease.

AB It is shown here that hedgehog proteins possess novel activities beyond phenotype specification. Using cultures derived from the embryonic day 14.5 (E14.5) rat ventral mesencephalon, we show that hedgehog is also trophic for dopaminergic neurons. Interestingly, hedgehog not only promotes dopaminergic neuron survival, but also promotes the survival of midbrain GABA-immunoeractive (GABA-ir) neurons.

LANGUAGE: English

SUMMARY LANGUAGE: English

AB The Venereal Disease Research Laboratory (VDRL) test is a microflocculation test for **syphilis** that uses an **antigen** containing **cardiolipin**, **lecithin**, and cholesterol. For more than 50 years, the preparation of natural **cardiolipin** and **lecithin** for this test has been based on the Pangborn method which involves isolating and purifying these components from beef hearts. This process is tedious and time-consuming and results in a variable purity range. In our studies, we found that a VDRL **antigen** using **synthetic tetramyristoyl cardiolipin** and **synthetic 1-palmitoyl-2-oleoyl-sn-glycero-3-phosphocholine (lecithin)** was as specific in **detecting syphilis** as a VDRL **antigen** made with natural components. In 85% of the cases, we obtained an endpoint titer of 1/2 or 1 dilution more than a titer obtained with a VDRL **antigen** made with natural components. The use of these pure **synthetic** compounds, with a purity of 99%, would offer advantages in the standardization and stability of the VDRL **antigen**. Because this **antigen** is the basic ingredient in the preparation of nontreponemal reagents such as the rapid plasma reagin, toluidine red unheated serum test, and the unheated serum reagin, the use of this **synthetic** VDRL **antigen** should also increase the reactivity of these reagents.

AB The present invention provides a method for determining the presence of a class of an antibody in a biological sample. In this method, a first reagent including insoluble particles having an antigen to the antibody immobilized on the surface thereof, and a second reagent including insoluble magnetic particles having immobilized on the surface thereof a substance particularly reactive to a specific immunoglobulin class, is reacted with the sample under conditions to promote agglutination of the first and second reagents with the antibody. The unreacted second reagent and the agglutinate are separated from the unreacted first reagent by application of a magnetic field. Then the amount of unreacted first reagent is determined.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The subject invention concerns novel compositions for use in immunoassays, as well as immunoassays employing such novel compositions. The compositions comprise discrete charged colloidal particles comprised of small molecules which particles are capable of retaining their discrete character in an aqueous medium and composed of aggregates of lipophilic and/or amphiphilic organic molecules to which are bound non-covalently a label capable of producing a detectable signal and a ligand or an analog of the ligand capable of competing with a ligand for a ligand receptor. The discrete colloidal particle serves as a hub or nucleus for retaining the ligand or its analog and the label within a limited locus.

The compositions are prepared by individually covalently bonding the ligand and the label, when not naturally lipophilic, to a lipophilic (includes amphiphilic) compound, normally a phospholipid. Depending upon the nature of the particle, the amphiphilic conjugated ligand and label are combined with the particle or alternatively may be combined with the compounds employed for preparing the particle under particle forming conditions. Particles are then obtained having the analog of the ligand and the label bound to the particle.

The compositions find use in immunoassays where an interaction between the label and receptor provides a means for modulating a detectable signal. The interaction can be as a result of quenching or modification of fluorescence, where the label is a fluorescer, steric inhibition of the approach of a signal modifier to the label, such as a label receptor or with an enzyme label, an antienzyme or enzyme inhibitor, the inhibition of cleavage of an enzyme labile bond or the cooperative interaction of two labels, such as two enzymes, where the product of one enzyme is a substrate of another enzyme.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB An **antigen** compn. and method for the **detection of**
antibodies to *Treponema pallidum* and the diagnosis of
syphilis are described. The **antigen** compn. contains
synthetic cardiolipin and **synthetic**
lecithin. The **antigen** compn. may addnl. contain
cholesterol and an alc. The **antigen** compn. is useful as
an immunoreagent in immunoassays for the **detection of**
antibodies assocd. with *T. pallidum* infection. The methods are
sensitive and specific for *T. pallidum* infection.

SUMMARY LANGUAGE: English

AB The Venereal Disease Research Laboratory (VDRL) test is a microflocculation test for **syphilis** that uses an **antigen** containing **cardiolipin**, **lecithin**, and **cholesterol**. For more than 50 years, the preparation of natural **cardiolipin** and **lecithin** for this test has been based on the Pangborn method which involves isolating and purifying these components from beef hearts. This process is tedious and time-consuming and results in a variable purity range. In our studies, we found that a VDRL **antigen** using **synthetic** tetramyristoyl **cardiolipin** and **synthetic** 1-palmitoyl-2-oleoyl-sn-glycero-3-phosphocholine (**lecithin**) was as specific in **detecting** **syphilis** as a VDRL **antigen** made with natural components. In 85% of the cases, we obtained an endpoint titer of 1/2 or 1 dilution more than a titer obtained with a VDRL **antigen** made with natural components. The use of these pure **synthetic** compounds, with a purity of 99%, would offer advantages in the standardization and stability of the VDRL **antigen**. Because this **antigen** is the basic ingredient in the preparation of nontreponemal reagents such as the rapid plasma reagin, toluidine red unheated serum test, and the unheated serum reagin, the use of this **synthetic** VDRL **antigen** should also increase the reactivity of these reagents.

AB It is shown here that hedgehog proteins possess novel activities beyond phenotype specification. Using cultures derived from the embryonic day 14.5 (E14.5) rat ventral mesencephalon, we show that hedgehog is also

trophic for dopaminergic neurons. Interestingly, hedgehog not only promotes dopaminergic neuron survival, but also promotes the survival of midbrain GABA-immunoeractive (GABA-ir) neurons.

AB For use in a lipid-dependent diagnostic assay, a stable aqueous suspension of a phospholipid which normally has a hexagonal (H._{sub}II) organization when dispersed in an aqueous medium without detergent, the suspension containing the phospholipid, a detergent, and an aqueous phase. In the stable suspension, the phospholipid remains in suspension at a temperature of 25.degree. C. for at least one hour. The suspension is suitable for providing the phospholipid to an assay for lupus anticoagulants which includes the step of pre-incubating a test sample with the phospholipid.

AB The present invention provides a method for determining the presence of a class of an **antibody** in a biological sample. In this method, a first reagent including insoluble particles having an antigen to the **antibody** immobilized on the surface thereof, and a second reagent including insoluble magnetic particles having immobilized on the surface thereof a substance particularly reactive to a specific immunoglobulin class, is reacted with the sample under conditions to promote agglutination of the first and second reagents with the **antibody**. The unreacted second reagent and the agglutinate are separated from the unreacted first reagent by application of a magnetic field. Then the amount of unreacted first reagent is determined.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

The particles are stabilized by a surface layer comprising an amphiphilic compound and may be functionalized to allow covalent coupling of a ligand to the surface of the particle. When used as tracers in assays, a water insoluble dye may be incorporated in the core liquid of the microparticles.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Stabilized microspherical particles having hydrophobic liquid cores prepared as oil-in-water microemulsions. The particles are stabilized by a surface layer comprising an amphiphilic compound and may be functionalized to allow covalent coupling of a ligand to the surface of the particle. When used as tracers in assays, a water insoluble dye may be incorporated in the core liquid of the microparticles.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The subject invention concerns novel compositions for use in immunoassays, as well as immunoassays employing such novel compositions. The compositions comprise discrete charged colloidal particles comprised of small molecules which particles are capable of retaining their discrete character in an aqueous medium and composed of aggregates of lipophilic and/or amphiphilic organic molecules to which are bound non-covalently a label capable of producing a detectable signal and a ligand or an analog of the ligand capable of competing with a ligand for a ligand receptor. The discrete colloidal particle serves as a hub or nucleus for retaining the ligand or its analog and the label within a limited locus.

The compositions are prepared by individually covalently bonding the ligand and the label, when not naturally lipophilic, to a lipophilic (includes amphiphilic) compound, normally a phospholipid. Depending upon the nature of the particle, the amphiphilic conjugated ligand and label are combined with the particle or alternatively may be combined with the

compounds employed for preparing the particle under particle forming conditions. Particles are then obtained having the analog of the ligand and the label bound to the particle.

The compositions find use in immunoassays where an interaction between the label and receptor provides a means for modulating a detectible signal. The interaction can be as a result of quenching or modification of fluorescence, where the label is a fluorescer, steric inhibition of the approach of a signal modifier to the label, such as a label receptor or with an enzyme label, an antienzyme or enzyme inhibitor, the inhibition of cleavage of an enzyme labile bond or the cooperative interaction of two labels, such as two enzymes, where the product of one enzyme is a substrate of another enzyme.

INT-CL (IPC): G01N 33/16

ABSTRACTED-PUB-NO: JP 74046051B

BASIC-ABSTRACT:

The antigen and carrier of particle size 0.05-1.0 μ are suspended in water. The C is heated in 1-3N-nitric acid under reflux for about 2 hrs. in a water bath and washed repeatedly by decantation. After 3-5 days washing, Ph of the carrier dispersion becomes 4-5. The dispersion is neutralised with a sodium hydroxide soln. to pH 7.0. When active carbon is used in this case, the prod. cannot be used as such because it is irregular in size. So collection of the carbon with comparatively small particle size is repeated by decantation. The aq. suspension is obt. by prep. a suspension of cardiolipin, lecithin and cholesterol by mixing 1 pt. of antigen contng. 0.03% cardiolipin, 0.9% cholesterol and 0.2% lecithin with 9 pts. of a buffered sodium chloride soln. contng. sodium chloride, disodium hydrogen phosphate and potassium dihydrogen phosphate is centrifuged at 3000 rpm. for about 15 mins. and the supernatant liq. is discarded. To the residual white ppt., is added the carbon dispersed in a buffer soln. at pH 6.0-7.0, and the resultant mixt. is well shaken to obtain a homogeneous suspension contng. cardiolipin, cholesterol, lecithin and carbon.

In order to increase agglutination, a metal chelating agent, e.g. EDTA or citric acid, an amine, e.g. ammonium chloride or ethhanolamine, antiseptic, e.g. formalin, phenylmercuric nitrate or phenol and glycerol or ethylene glycol may be added to the carbon buffer soln. if needed. When one drop (1/60 ml.) of the prep. antigen suspension is mixed with 0.03-0.05 ml. of positive serum and allowed to react for 2-5 mins. with rotation, a visible black agglutinated mass appears.

INT-CL (IPC): G01N 33/543; G01N 33/553; G01N 33/571

ABSTRACTED-PUB-NO: JP 05312808A

BASIC-ABSTRACT:

Immunoassay comprises (i) adding a sample to a reaction vessel contg. a solid phase carrier on which lipid antigen is fixed and carrying out the antigen-antibody reaction of the lipid antigen and antibody in the sample, (ii) adding antibody-sensitised magnetic particles to the reaction vessel and carrying out the antigen-antibody reaction of the antibody bound with the lipid antigen and the antibody-sensitised magnetic particles and (iii) determining a pattern formed on the carrier.

The lipid antigen pref. contains cardiolipin, lecithin and cholesterol. The ratio of the cardiolipin to the lecithin is 1-50 wt.%. The reaction vessel is a microplate well to U-form, flat or V-form bottom. Antibody used for sensitising the antibody-sensitised magnetic particles is anti-human IgG or anti-human IgM.

USE/ADVANTAGE - Used esp. for examining syphilis. The immunoassay can be completed in about 10 mins. in contrast with hours required for some previous enzyme immunoassays. Non-specific reaction can be depressed and stable analytical results of high S/N ratio can be obtd.. The judgment of positivity or negativity of syphilis can be easily and objectively carried out by eyes.

In an example, blood serum samples negative or positive to syphilis were examined by the immunoassay using anti-human IgG-sensitised particles contg. magnetic matter. When the blood serum sample was positive for syphilis, a distinct positive image of the particles extended over the whole surface of microplate well was obtd.. When the sample was negative, a bottom-form negative image aggregated at the bottom face of the well was obtd..

USE/ADVANTAGE - Used esp. for examining syphilis. The immunoassay can be completed in about 10 mins. in contrast with hours required for some previous enzyme immunoassays. Non-specific reaction can be depressed and stable analytical results of high S/N ratio can be obtd.. The judgment of positivity or negativity of syphilis can be easily and objectively carried out by eyes.

Basic Abstract Text (4):

In an example, blood serum samples negative or positive to syphilis were examined by the immunoassay using anti-human IgG-sensitised particles contg. magnetic matter. When the blood serum sample was positive for syphilis, a distinct positive image of the particles extended over the whole surface of microplate well was obtd.. When the sample was negative, a bottom-form negative image aggregated at the bottom face of the well was obtd..
